Organization

Organizing Accounts as Organizational Units and Manage Resources

Organization is a service that manages accounts hierarchically by configuring them into organizations and sub-organizational units, and controls resource access authorization by organization unit and account. This enables resource usage management and cost optimization of accounts belonging to an Organization.

Hierarchical Organization Management

Users can invite or create other accounts to the Organization, allowing hierarchical organization and management by organizational unit. Resource usage and costs of all accounts belonging to the Organization can be monitored.

Organization Unit Governance

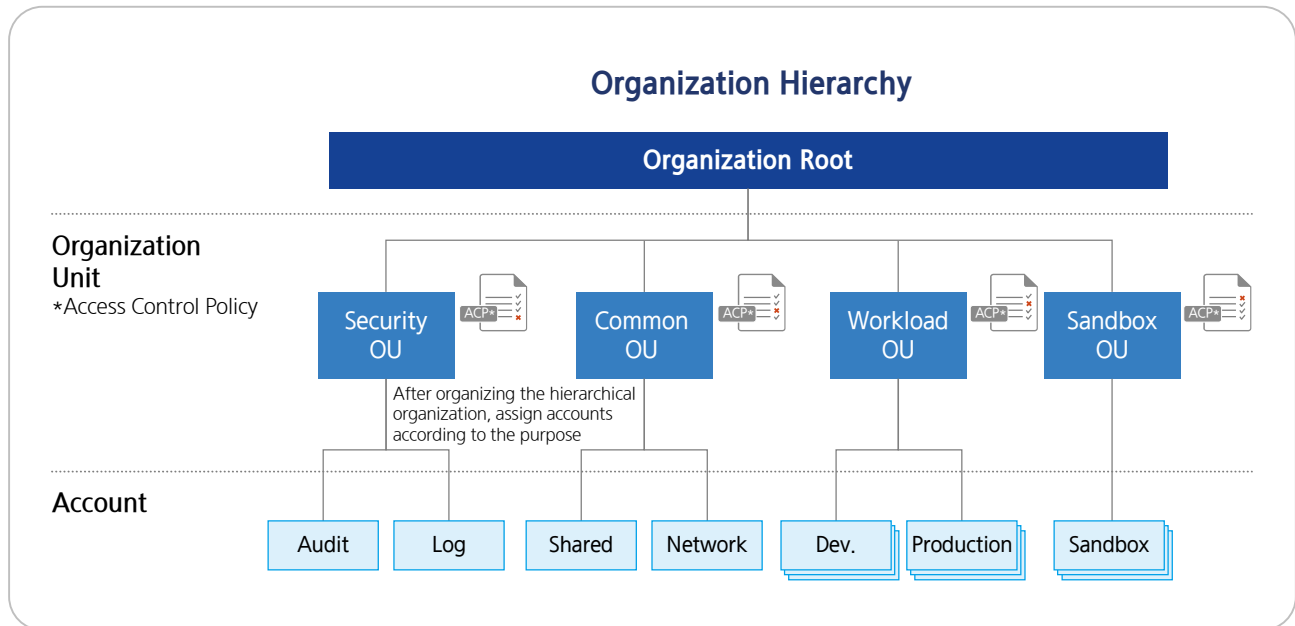

By configuring the necessary policies according to organizational unit as access control policy and applying them to the Organization Unit, users can apply the policy to all accounts under the organization without having to apply it to each individual account.

Optimizing Resource Costs

Organization's management account can identify resource usage of all member accounts within the organization and optimize costs through integrated billing.

Service Architecture

Key Features

- **Managing organization unit**
 - Managing accounts by grouping them into Organization Units
 - Controlling resource access policies by Organization Units
- **Managing access control policies**
 - Managing compliance-related configuration settings as policies
 - Prevent regulatory violations in advance by applying necessary policies according to organizational units
- **Effective resource management**
 - Centrally managing charges accrued by all accounts within an organization and resource usage policies
