# Integration Solution **APIM**

It's a solution that supports API-based integration of internal and external services and provides API lifecycle management, access control, traffic control, and load balancing.

## Integrated API Management

Offer an API operation & management portal (multi-tenancy, API sharing), an environment for API design/development/testing(mock API test), and API life cycle management from its creation to retirement.

## API Access Control & Security

Provide API authentication (Basic Auth, SAML, OAuth, etc.), enable applying security policies without changing API, and restrict access to APIs based on user, domain and client IP addresses.

## API Traffic Control & Load Balancing

Provide scaling out and load balancing depending on API usage while also offering traffic management by user level (gold, silver) and API usage stats.
